Random car mini-fling

Sometimes when driving around with a bunch of items in your car,
you will experience a "mini-fling".

One wheel will suddenly jump upwards and your items will fall out of your car.

It happens exceedingly often in the cave crawler maze and the only thing unique to that place regarding physics is that you brake a lot with your car and drive up a slope at the end, so those might be a contributors to the bug

The reason for this is unknown, it's assumed to be a roblox engine bug.
